1. Summary of test results

The test results apply exclusively to the test samples as presented in this Report. The CETECOM GmbH does not assume responsibility for any conclusions and generalizations taken in conjunction with other specimens or samples of the type of the item presented to tests.

Following tests have been performed to show compliance with applicable FCC Part 2.1091 and FCC Part 1.1310 of the FCC CFR 47 Rules.

The presented Equipment Under Test (in this report, hereinafter referred as EUT) integrates an already FCC certified cellular module

 $\label{lem:constraint} $$ \frac{\text{(https://apps.fcc.gov/oetcf/tcb/reports/Tcb731GrantForm.cfm?mode=COPY\&RequestTimeout=500\&tcb_code=\&applicat_ion_id=9meMwfWIt9XWT4kGcHMnCw%3D%3D\&fcc_id=XMR201312UC20}.$$ Other implemented wireless technologies were not considered within this test report.$

	procedure.		

3.2 Evaluation Rules for FCC Standard

Systems operating under the provisions of FCC 47 CFR section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy level in excess of the Commission's guidelines.

In accordance with 47 CFR FCC Part 2 Subpart J, section 2.1091 this device has been defined as mobile device whereby a distance of 0.2m normally can be maintained between the user and the device, and below RF Permissible Exposure limit shall comply with.

In accordance with KDB447498D01 for Simultaneous transmission MPE test exclusion applies when the sum of the MPE ratios for all simultaneous transmitting antennas incorporated in a host device, based on the calculated/estimated, numerically modelled or measured field strengths or power density, is ≤ 1.0 . The MPE ratio of each antenna is determined at the minimum test separation distance required by the operating configurations and exposure conditions of the host device, according to the ratio of field strengths or power density to MPE limit, at the test frequency. Either the maximum peak or spatially averaged results from measurements or numerical simulations may be used to determine the MPE ratios. Spatial averaging does not apply when MPE is estimated using simple calculations based on far-field planewave equivalent conditions. The antenna installation and operating requirements for the host device must meet the minimum test separation distances required by all antennas, in both standalone and simultaneous transmission operations, to satisfy compliance.

3.3 Limits for FCC Standard

Table 1: LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)

	(A) Limits for Occupational/Controlled Exposure									
Frequency range	Electric field strength	Magnetic field strength	Power density	Averaging time						
[MHz)	[V/m]	[A/m]	[mW/cm ²]	[minutes]						
0.3-3.0	614	1.63	(100)*	6						
3.0-30	1842/f	4.89/f	(900/f ²)*	6						
30-300	61.4	0.163	1.0	6						
300-1500				6						
1500-100,000	1	1		6						
	(B) Limits for G	Seneral Population/Uncontr	olled Exposure							
Frequency range	Electric field strength	Magnetic field strength	Power density	Averaging time						
[MHz)	[V/m]	[A/m]	[mW/cm ²]	[minutes]						
0.3-3.0	614	1.63	*(100)	30						
3.0-30	824/f	2.19/f	*(180/f²)	30						
30-300	27.5	0.073	0.2	30						
300-1500	-	-	f/1500	30						
1500-100,000	-	-	1.0	30						

f=frequency in MHz

NOTE1: Occupational/controlled limits apply in situations in which persons are exposed as a consequence of their employment provided those persons are fully aware of the potential for exposure and can exercise control over their exposure. Limits for occupational/controlled exposure also apply in situations when an individual is transient through a location where occupational/controlled limits apply provided he or she is made aware of the potential for exposure. These limits apply to amateur station licensees and members of their immediate household as discussed in the text.

NOTE2: General population/uncontrolled exposures apply in situations in which the general public may be exposed, or in which persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or cannot exercise control over their exposure. As discussed in the text, these limits apply to neighbours living near amateur radio stations.

^{*}Plane-wave equivalent power density

3.4 Requirements and limits for RSS Standard

2.5 Exemption Limits for Routine Evaluation

All transmitters are exempt from routine SAR and RF exposure evaluations provided that they comply with the requirements of sections 2.5.1 or 2.5.2. If the equipment under test (EUT) meets the requirements of sections 2.5.1 or 2.5.2, applicants are only required to submit a properly signed declaration of compliance (see <u>Annex C</u>). The information contained in the RF exposure technical brief may be limited to the value(s) of the maximum output power, the information that demonstrates how the maximum output power of the transmitter was derived and the rationale for the separation distances applied (see <u>Table 1</u>), which must be based on the most conservative exposure condition for the applicable module or host platform test procedure requirements.

2.5.2 Exemption Limits for Routine Evaluation — RF Exposure Evaluation

RF exposure evaluation is required if the separation distance between the user and/or bystander and the device's radiating element is greater than $20~\rm cm$, except when the device operates as follows:

- below 20 MHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than 1 W (adjusted for tune-up tolerance);
- at or above 20 MHz and below 48 MHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than 4.49/f^{0.5} W (adjusted for tune-up tolerance), where f is in MHz;
- at or above 48 MHz and below 300 MHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than 0.6 W (adjusted for tune-up tolerance);
- at or above 300 MHz and below 6 GHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than $1.31 \times 10^{-2} f^{0.6834}$ W (adjusted for tune-up tolerance), where f is in MHz;
- at or above 6 GHz and the source-based, time-averaged maximum e.i.r.p. of the device is equal to or less than 5 W (adjusted for tune-up tolerance).

In these cases, the information contained in the RF exposure technical brief may be limited to information that demonstrates how the e.i.r.p. was derived.

2.6 User Manual Requirements

The applicant is responsible for providing proper instructions to the user of the radio device, and any usage restrictions, including limits of exposure durations. The user manual shall provide installation and operation instructions, as well as any special usage conditions (e.g. proper accessory required, including the proper orientation of the device in the accessory, maximum antenna gain in the case of detachable antenna), in order to ensure compliance with SAR and/or RF field strength limits. For instance, compliance distance shall be clearly stated in the user manual.

The user manual of devices intended for controlled use shall also include information relating to the operating characteristics of the device; the operating instructions to ensure compliance with SAR and/or RF field strength limits; information on the installation and operation of accessories to ensure compliance with SAR and/or RF field strength limits; and contact information where the user can obtain Canadian information on RF exposure and compliance. Other related information may also be included.

3.5 MPE Calculation method

Predication of MPE limit at a given distance Equation from page 18 of OET Bulletin 65, Edition 97-01

$$S = \frac{EIRP}{4\pi R^2} = \frac{P * G}{4\pi R^2}$$

$$G_{NUMERIC} = \frac{S * 4\pi R^2}{P}$$

Where: S=power density P=power input to antenna

G=power gain of the antenna in the direction of interest relative to an isotropic radiator

R=distance to the centre of radiation of the antenna

Regarding tune-up information maximum average output power is 24dBm +1dB tolerance. Applying customer's declared tolerance of 1dB to the results of conducted power verification are below 25dBm.

3.7 Evaluation Method

3.7.1 Standalone

Valid for Cellular 3G Mode:

A RMS detector was used. No duty-cycle correction factor is applicable

Please find in the following tables the calculations based on applicants tune-up information for the power values.

Results for FCC Standard

Wireless	Output	power*	Antenna	Duty	MPE	MPE	Verdict	
Technologies	dBm	mW	Gain (dBi)	Cycle	(mW/cm ²)	Limits (mW/cm ²)		
WCDMA FDD Band 2	25.0	525	2.2	100%	0.1044	1.0000	Pass	
WCDMA FDD Band 5	25.0	525	2.2	100%	0.1712	0.5576	Pass	

Remark:

- 1. Output power (Average) including tune-up tolerance;
- 2. Output power was adjust to duty cycle at 100% if measured duty cycle less than 98%;
- 3. MPE evaluate distance is 20cm from user manual provide by manufacturer;
- 4. Depending on output power and antenna gain only the worst case is reported;

FDD Band 2 (RMS-	1880,0	24,0	1,0	2,20	0,00	0,00	27,20	100%	0,5248	0,5248	4,5258	1,0441	3,4817	0,23069340	0,2330369
Value)	1907,6	24,0	1,0	2,20	0,00	0,00	27,20		0,5248	0,5248	4,5711	1,0441	3,5270	0,22840711	

Maximum ca	Maximum calculated MPE value:									
Lowest MPE- Limit within frequency-band:	4,4803	[W/m ^2]								
Highest MPE value within frequency-band:	1,0441	[W/m ^2]								
Lowest margin to limit within frequency-band:	3,4362	[W/m ^2]								

Remark:

- 1. Output power (Average) including tune-up tolerance;
- 2. Output power was adjust to duty cycle at 100% if measured duty cycle less than 98%;
- 3. MPE evaluate distance is 20cm from user manual provide by manufacturer;
- 4. Depending on output power and antenna gain only the worst case is reported;

3.7.3 Simultaneous Transmission MPE

According to KDB447498 for Transmitters used in mobile exposure conditions for simultaneous transmission operations; \sum of MPE ratios \leq 1.0

PFC200 CS 2ETH RS 3G use only one transmitter antenna, no need consider simultaneous transmission.

3.8 Conclusion

The measurement results comply with the FCC Limit per 47 CFR 2.1091 for the uncontrolled RF Exposure of mobile device.

The measurement results comply with the RSS-102, Issue 5.

4 Measurement uncertainties

The reported uncertainties are calculated based on the standard uncertainty multiplied with the appropriate coverage factor \mathbf{k} , such that a confidence level of approximately 95% is achieved.

For uncertainty determination, each component used in the concrete measurement set-up was taken in account and it's contribution to the overall uncertainty according it's statistical distribution calculated.

Following table shows expectable uncertainties for each measurement type performed.

RF-Measurement	Reference	Frequency range	Calculated uncertainty based on a confidence level of 95%			Remarks			
Conducted emissions (U CISPR)	CISPR 16-2-1	9 kHz - 150 kHz 150 kHz - 30 MHz	4.0 dB 3.6 dB				-		
Radiated emissions Enclosure	CISPR 16-2-3	30 MHz - 1 GHz 1 GHz - 18 GHz	4.2 dB 5.1 dB					E-Field	
Disturbance power	CISPR 16-2-2	30 MHz - 300 MHz	-				-		
Power Output radiated	-	30 MHz - 4 GHz	3.17 dB					Substitution method	
D. O. A. A. A. A.		Set-up No.	Cel- C1	Cel- C2	BT1	W1	W2		
Power Output conducted	-	9 kHz - 12.75 GHz	N/A	0.60					-
		12.75 - 26.5GHz	N/A	0.82					
Conducted emissions	-	9 kHz - 2.8 GHz	0.70	N/A					N/A - not
on RF-port		2.8 GHz - 12.75GHz	1.48	N/A					applicable
		12.75 GHz - 18GHz	1.81	N/A					
		18 GHz - 26.5GHz	1.83	N/A

			1.0 dB				Power		
	-	0.1272 ppm (Delta Marker)					Frequency		
Emission bandwidth		9 kHz - 4 GHz						error	
	-		See above: 0.70 dB				Power		
Frequency stability	-	9 kHz - 20 GHz	0.0636 ppm			-			
		150 kHz - 30 MHz	5.0 dE						Magnetic
Radiated emissions	_	30 MHz - 1 GHz	4.2 dB				field		
Enclosure		1 GHz - 20 GHz	3.17 d	B					E-field
									Substitution

Table: measurement uncertainties, valid for conducted/radiated measurements

5 Abbreviations used in this report

The abbreviations				
ANSI	American National Standards Institute			
AV, AVG, CAV	Average detector			
EIRP	Equivalent isotropically radiated power, determined within a separate measurement			
EUT	Equipment Under Test			
FCC	Federal Communications Commission, USA			
n.a.	not applicable			
Op-Mode	Operating mode of the equipment			
PK	Peak			
RBW	resolution bandwidth			
RF	Radio frequency			
RSS	Radio Standards Specification, Documents from Industry Canada			
Rx	Receiver			
TCH	Traffic channel			
Tx	Transmitter			
QP	Quasi peak detector			
VBW	Video bandwidth			
ERP	Effective radiated power
